Project Proposal

For my final project I would like to program an Amazon Alexa Skill, in Java, using AWS and Amazon's Lambda. I would like to start off coding a game. Perhaps, Alexa can say different letters, and the user would have to make a word or words out of the letters given. Alexa would keep score and remember different usernames in order to compete with friends. In addition, I would like to program Alexa to read things directly off of a website the user commands. For example, I would like to be able to give her the title of a song or video off of YouTube, and she would be choose a video and play it.
